

It is very important to have the brakes equalized. To have equalized brakes, both pedals must have the same amount of free movement.

To check the equalization of the brakes, jack up both rear wheels so they will turn freely, block the tractor securely and latch the brake pedals together; then start the engine. Shift the gears to either third or fourth speed and engage the clutch; while the wheels are turning,

apply the brakes.

Application of the brakes should slow down both wheels at the same time and also reduces the speed of the engine.

If one wheel stops and the other wheel continues to revolve when the brakes are applied, loosen the adjustment on the wheel that stops just enough so both wheels stop simultaneously when the brakes are applied.
